

Financial Sankey Token Guide (Type Column)

Your Sankey input uses **4 columns**:

1. **Source**
2. **Target**
3. **Value**
4. **Type** (*optional tokens / flags*)

The **Type** column lets you control:

- **Color category** (profit, cost, tax, savings, investment, etc.)
 - **Special rendering** (hide helper nodes, equity behavior)
 - **Label side** (left/right)
 - **Horizontal positioning** (move nodes left/right)
 - **Extra spacing** (before/after nodes)
-

1) Basic color category tokens

Use these in the **Type** column to classify a node (usually the **target node** of a row).

Core tokens

- INPUT → input/inflow color (gray)
- PROFIT → profit color (green)
- COST → cost color (red)
- EQUITY → equity color

- TAX → tax color
- SAVINGS → savings color
- INVESTMENT → investment color

Synonyms also recognized

- LIAB
 - LIABILITY
 - LIABILITIES
- (these are treated like **cost**)
-

2) Special behavior tokens

Hide helper nodes

- **HIDE**
Creates a hidden routing/helper node (useful for shaping flows without showing the node block).

Equity variants

- **EQUITY_LONG**
- **EQUITY_SHORT**

These modify how equity-style nodes are positioned/rendered.

3) Label position tokens

These control where the label appears relative to the node.

- **LBLLEFT**
 - **LBLRIGHT**
 - **LABELLEFT**
 - **LABELRIGHT**
-

4) Horizontal shift tokens (move nodes by columns)

You can shift a node horizontally from its automatic column position.

Move left

- **BACK**
- **LEFT**

Move right

- **RIGHT**

Add a number (multiple steps)

- **BACK2 / LEFT2** → move 2 columns left
- **RIGHT2** → move 2 columns right
- **RIGHT3** → move 3 columns right

If no number is given, it means **1 step**.

5) Spacing tokens (vertical spacing around nodes)

Use these to create visual gaps between nodes.

- SPACE=20
- SPACING=20
- SPACE_BEFORE=15
- SPACE_AFTER=25

Notes

- SPACE and SPACING act as general spacing (especially after-node spacing)
 - SPACE_BEFORE and SPACE_AFTER give you precise control
-

6) Multiple tokens in one cell

You can combine multiple tokens in the same **Type** cell, separated by commas.

Example

COST,RIGHT,SPACE_BEFORE=20

This means:

- cost category color
 - label/node alignment token(s)
 - extra spacing before the node
-

7) Example rows

Tax flow

Revenue Tax 120000 TAX

Savings bucket shifted right

Net Income Savings 45000 SAVINGS,RIGHT

Investment helper split (hidden node)

Investments Bonds Split 75000 HIDE

Cost node with spacing

Operating Marketing 84000 COST,SPACE_BEFORE=12

8) Good practices

- Use **uppercase tokens** for readability (recommended)
 - Keep tokens in the **Type** column only
 - Put **one row per flow**
 - Use HIDE nodes for layout/routing if needed
 - Use TAX / SAVINGS / INVESTMENT for dedicated financial coloring
-

9) Minimal template

A simple valid table looks like this:

- Source
- Target
- Value
- Type

Example:

- Gross Income | Net Income | 3200 | INPUT
 - Net Income | Taxes | 950 | TAX
 - Net Income | Savings | 300 | SAVINGS
 - Net Income | Investments | 400 | INVESTMENT
 - Net Income | Housing | 1000 | COST
-

If you leave the **Type** cell empty, the engine will still draw the flow, but color/category behavior will fall back to automatic logic.
